[9]p. (foreign text included) 4 refs.
Order from SLA \$1.10 61-14727

Trans. of Glastechnische Berichte (West Germany)
1960, v. 33, no. 8, p. 281-283.

DESCRIPTORS: *Brick, *Glass, Chemical reactions.

When a fireclay body reacts with a limited amount of stagnant glass, the glass is locally impoverished in alkali, and the striae originating there exhibit the characteristic aluminous layers as well as those impoverished in alkali, i.e. enriched in SiO_2 . This can be demonstrated in the glass from a cavity in a float. The threads from such a hollow space normally have an aluminous core and an envelope of which the SiO_2 content is increased by 0.5 to 1%. (Author)
